Product Name:
InboxFlow

Problem Statement:

Important emails that require attention (meeting invitations, boss/coworker questions, client messages, and emails containing key documents or links) often get buried in a crowded inbox as newer messages push them down, making users scroll or search for several minutes to find them later. As a result, this can lead to forgetting to reply to requests, struggling to relocate shared documents, or missing meeting invites or links.

Primary User:

A busy corporate employee in a large, team-based office environment who receives over 40 emails per day and relies on email to manage meetings, shared documents, and ongoing requests from coworkers and clients.

User Context:

The user encounters this problem daily when having a hard time finding their important emails right before meetings or during the busy work hours. Important information often gets lost among less important messages, especially when the user is between back-to-back meetings and doesn't have time to sort or scroll through all of their emails to find an important email.

Product Vision:

This product will help business professionals automatically keep important messages organized and easy to retrieve, so they spend less time searching their inbox and more time focusing on their work and responding to action items quickly. This app will sort emails into 3-4 folders based on user preferences.

In Scope:

- Automatically organize emails into categories based on keywords and email context using AI.
- Users can name and set their own folders or use general/default folders.
- The app works with all major email platforms (Gmail, Outlook, iCloud Mail, etc).

Explicitly Out of Scope:

- Writing email replies or responding automatically.
- Filtering emails for spam or phishing.
- Replacing the user's existing email platform (the user will continue using their current email service).

Key Indicators of Success:

What success looks like for the user:

- Important emails [can be quickly found when needed](#) without the user needing to [search through the inbox](#).
- Meeting details and links can be found when needed.
- External documents don't get buried and are easier to find inside smaller folders/categories.

What success looks like for the product:

- High accuracy in automatically categorizing emails.
- Faster retrieval time for important emails.
- Reduced missed or late action items due to lost emails.

North Star Metric

- 98% of important emails are successfully categorized and retrievable within 15 seconds.

Supporting Metrics

1. Average time spent searching for important emails per day (minutes/day).
2. Number of missed or late action items reported by users per month due to not finding an email in time.

One Pager from AI

Persona Name

The Time-Pressed Corporate Employee

Role Summary

A busy corporate employee working in a large, team-based office environment. The user receives over 40 emails per day and relies on email as the primary method for managing meetings, shared documents, and ongoing requests from coworkers and clients. Email serves as the central communication channel for coordinating work across teams.

Primary Goal

To quickly find important emails when needed without spending time searching through a crowded inbox or missing critical information.

Context of Use

The user encounters inbox overload daily, particularly during high-pressure moments such as right before meetings or throughout busy work hours. New emails continuously arrive, pushing important messages further down the inbox. As the user moves between back-to-back tasks with limited time to manage messages, they rely on quick scrolling and searching to locate what they need instead of organizing their inbox.

Key Pain Points

- Important emails get buried as new messages arrive
- Several minutes are spent scrolling or searching for information
- Requests are forgotten or replied to late
- Meeting links are difficult to locate right before calls
- Shared documents are hard to relocate quickly

Constraints

- High daily email volume (40+ emails)
- Limited time between meetings and tasks
- Continuous incoming messages throughout the day
- Email is the primary system for managing work communication

Stock-Style Photo Description

A professional seated at a desk in a modern open-office environment, leaning slightly forward toward a laptop displaying a crowded email inbox. The posture shows focus and mild urgency, with one hand on the mouse and the other near the keyboard. Soft natural light comes through large office windows, while coworkers move and talk quietly in the background, suggesting a fast-paced, collaborative workday.
